11.1. Information on toxicologica	al effects		
Skin corrosion/irritation	Prolonged or repeated exposure may cause irritation to skin and mucous membranes.		
Serious eye damage/irritation	No irritation expected.		
Respiratory or skin sensitisation	No sensitizaton effects reported.		
Germ cell mutagenicity	No mutagenic effects reported.		
Carcinogenicity	Known Human Carcinogens (Category 1).		
Reproductive toxicity	No observed effect level. No observed effect concentration.		
STOT-single exposure	No known adverse health effects.		
STOT-repeated exposure	Chronic effects Prolonged inhalation of respirable crystalline silica In 1997, the International Agency for Research on Cancer (IARC) concluded that crystalline silica inhaled from occupational sources can cause lung cancer in humans. However it pointed out that not all industrial circumstances, nor all crystalline silica types, were to be incriminated. (IARC Monographs on the evaluation of the carcinogenic risks of chemicals to humans, Silica, silicates dust and organic fibers, 1997, Vol. 68, IARC, Lyon, France). In June 2003, the European Commission's Scientific Committee for Occupational Exposure Limits (SCOEL) concluded: "that the main effect in humans of the inhalation of respirable crystalline silica is silicosis. There is sufficient information to conclude that the relative lung cancer risk is increased in persons with silicosis (and apparently, not in employees without silicosis exposed to silica dust in quarries and in the ceramic industry). Therefore, preventing the onset of silicosis will also reduce the cancer risk. Since a clear threshold for silicosis development cannot be identified, any reduction of exposure will reduce the risk of silicosis." (SCOEL SUM Doc 94-final on respirable crystalline silica, June 2003) There is a body of evidence supporting the fact that increased cancer risk would be limited to people already suffering from silicosis. Worker protection against silicosis should be assured by		
	respecting the existing regulatory occupational exposure limits and implementing additional risk		
	management measures where required (see Section 16).		
Aspiration hazard	No Significant Hazard.		
Repeated or prolonged exposure	Inhalation may cause coughing, tightness of the chest and irritation of the respiratory system.
